Credit Freeze

A credit freeze restricts people from opening accounts in your name without consent, preventing the case of an identity theft. If a lender can't view your credit, then they wouldn't be able to open anything unless you unfreeze your credit. There are 4 major credit agencies that I have frozen my credit with: [Equifax](#), [Experian](#), [TransUnion](#), and [Innovis](#).

I will keep the credit reports frozen to ensure my safety for my identity. It's free to keep my credit frozen and ensures that things can't be opened under my name. I rather go through the process of unfreezing my credit than to keep my identity from being used to open loans and other things. After my credit is processed for whatever reason I needed it, I will freeze it as soon as possible to ensure my safety remains.

For information on accounts, refer to notes app for usernames / passwords or Bitwarden (password manager) and personal identification forms located in the gray basket to access these accounts. In the case that my information is compromised, I can refer to my mother, [REDACTED], for information on my accounts as she knows my personal identification information.

The experience of having my credit frozen has been good. Though I don't have any major things going on to where my credit may change, these agencies provide insight about steps I can take, or things that I may need to look out for moving forward.

Proof of Freezes (October 21, 2025)

Your file is frozen

Security freeze blocks most access to your Experian credit file, while still allowing you to view and monitor your credit.

Unfrozen

Frozen

Confirmation

Thank you for your request
A Security Freeze has successfully been added to your Innovis Credit Report.

What happens next?

Confirmation Letter
Your confirmation letter containing the requested information will be sent via U.S. mail to the address that you have provided.

Please review your information. If you have any questions, please contact Innovis Consumer Assistance. Representatives are available to assist you Monday through Friday 8:00am - 8:00pm ET.

Asset Attribute Table

This table holds information about all the important assets that I currently hold, whether hardcopy or electronically. In the left hand column, it's the name of the asset. The second column describes what the asset is and what it is associated with. The column over specifically says where the asset is held and what locations it's in as there can be multiple copies. The fourth column is the primary owner of the asset or whoever is responsible for the asset. The fifth column is how important the asset is. The last column is a brief description of how important the asset is.

To review or adjust the attribute table, refer to the Excel sheet called "Asset Attribute Table (October 21, 2025)" and click at the bottom to land on the worksheet called "Asset Attribute Table." To ensure that there is only record of one attribute table, rename the sheet so the date is when it was last modified regardless of what was adjusted. Also included in the workbook is a worksheet called "Priority 1 Item Risk Analysis."

Asset Attribute Table (October 21, 2025)

Attribute ID (unique descriptor)	Description of Asset: Sufficiently descriptive to be meaningful to any legitimate user	Location(s): Identify all physical and virtual locations of the information resource. Be descriptive.	Asset owner: Identify the individual, group, or organization that who owns the asset. If ownership unclear, explain.	Protection priority (1-5): Subjective assessment of the importance of protecting the asset. 1 is highest and 5 is lowest.	
Financial Accounts	User IDs, passwords, security question answers for the following types of online accounts: banking, credit cards, investments, recurring payments	☒ Paper ☒ Desktop computer ☒ Laptop computer ☒ Home computer ☐ File share/server/database ☒ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps) Primarily kept in password manager application. Username and password also stored in note called "passwords"	Alexys is primary owner, but main bank account is shared with mother.	1	Account access management is my top personal cyber security concern and I will expend the resources necessary to feel like I am doing all I can reasonably do with the things that are within my control.
Bitwarden Password	User id and password to log into password manager	☒ Paper ☒ Desktop computer ☒ Laptop computer ☒ Home computer ☐ File share/server/database ☒ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps) On piece of paper given to Jazelle (roommate). Password stored in a note called "passwords"	Alexys and Jazelle (roommate) are the individuals that own the asset.	1	The loss of this password is very valuable as I would lose all the passwords I have saved on Bitwarden.
iCloud	All data shared through laptop, apple watch, iPhone, and iPad.	☐ Paper ☒ Desktop computer ☒ Laptop computer ☒ Home computer ☐ File share/server/database ☒ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps) Information is stored on devices in notes app or iCloud. If email and password are lost from notes app, there is a paper in gray basket along with personal identification forms	Alexys is the primary owner. Anyel (sister) has access to iCloud through shared iPad.	2	Losing access to my iCloud would mean I lose shared data throughout all my devices.
Gaming Accounts	Card information, name, email, address and such are information with these accounts.	☐ Paper ☒ Desktop computer ☒ Laptop computer ☒ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps) usernames and passwords are stored in notes app with note called "passwords"	Alexys is the primary owner.	4	Even though there is some significant information on my gaming accounts, losing access wouldn't have a big impact.

Social Media Account Login Credentials	Login information for social platforms like Instagram, Facebook, X, TikTok. Contain posts, private messages, family/friend information, connections to other accounts.	☐ Paper ☒ Desktop computer ☒ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner.	4	My social media is public and only holds emails and phone numbers, which anyone can find. Losing access to my social media accounts don't mean anything.
School Email	Main storage for academic/professional emails, key notes, notices, confidential discussions, contracts, intellectual property (research, documents). Has access to ADP for payroll.	☒ Paper ☒ Desktop computer ☒ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner.	2	As of right now, losing access to my school email would mean I lose access to all my school work, emails, class listing, etc. I believe this could be solved through the IT department, so it's not the highest priority.
Personal Email	Linked to all aspects of personal life. Contains access to online services, invoices, recovery information for other accounts, subscription services.	☐ Paper ☒ Desktop computer ☒ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner	2	My email mainly holds contact for subscriptions and such. It is also used to sign up for accounts. This is an important asset, but it is also linked to my mom's email for confirmation of logging into it and MFA is required. When signing up for things, my phone number is primarily used.
Macbook	personal laptop used for work and entertainment	☒ Paper ☐ Desktop computer ☐ Laptop computer ☒ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Alexys is primary owner.	2	this laptop holds a lot of information, but can only be accessed if the password is known or my finger is there to open it up. Only I know the password to my laptop.
Physical Forms of Identification (Birth Certificate, ID)	Non-replaceable personal identification information such Social Security number, date of birth. Official documents like birth certificates, passports, green cards, ownership documents, etc. Needed to verify identity, access services, and legal rights.	☒ Paper ☐ Desktop computer ☐ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☐ Mobile device (PDA, BlackBerry®, etc.) ☐ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner.	1	These forms of identification are what gives identity. Without these forms, I cannot apply for jobs, loans, etc. Someone gaining access to these forms can perform malicious activity under my identity.
Cell Phone	Communication device needed for daily life. Contains phone numbers, personal data, emails, passwords, photos, and essential apps like Apple Pay, credit cards, ID, contacts, etc.	☐ Paper ☐ Desktop computer ☐ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner.	1	Everything I do, need, and have is on my cell phone. Losing this would mean I lose most to all of my passwords, financial accounts, contacts, emails, and photos.
Certificates (Diploma, awards, etc.)	Certifications of school/awards completed/received.	☒ Paper ☒ Desktop computer ☒ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner.	4	Certificates show proof of things accomplished. I have nothing of high value so losing these wouldn't be a big of a deal.
Cell phone, Macbook, and iPad Mini credentials	passcode / phrase to unlock devices after a reboot	☒ Paper ☐ Desktop computer ☐ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☐ Mobile device (PDA, BlackBerry®, etc.) ☐ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner.	3	Though everything is on my phone, my phone gets backed up so I wouldn't lose everything.
iPad mini	Note taking device / project planning device.	☒ Paper ☐ Desktop computer ☒ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Alexys is the primary owner.	4	This device only holds notes taken for class, projects started for work, and other miscellaneous work. After working on notes and projects, it is usually always transferred over to another device, either MacBook or cell phone.

Shared Subscription Passwords (mom)	Copy of passwords shared with my mom (financials, subscriptions)	☒ Paper ☐ Desktop computer ☐ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Stored in Passwords app manager (iPhone) and Bitwarden. It is also stored in Notes called "passwords"	Alexys and mom are the primary owners.	3	Though I am one of the primary owners of these passwords, my mom likes to change the password every couple months for her safety. This allows me to make sure that these accounts are kept safe.
Wi-Fi/Network Passwords	Access to home network and Wi-Fi, ESSENTIAL for connecting all electronic devices: computers, smartphones, smart TVs, etc.	☒ Paper ☐ Desktop computer ☒ Laptop computer ☐ Home computer ☐ File share/server/database ☐ Portable media (CD/DVD, flash drive, etc.) ☒ Mobile device (PDA, BlackBerry®, etc.) ☒ Cloud Storage (e.g., Google Apps)	Uncle has passwords, but passwords are saved in password keychain (iCloud)	Uncle is the primary owner.	5	Holding this information isn't important at all. Since I do not own the information, losing access wouldn't mean a whole lot unless the passwords have been compromised.

Priority 1 Item Risk Analysis (October 21, 2025)

Priority 1 Item IDs	Threats: Identify possible threats to the asset and threat actors of concern	Likelihood of Threat(s) (1-10): Best guess on the likelihood of encountering the threats, 1 = not at all likely, 10 = fully expected	CIA Assessment: Descriptive statement about the impact of a loss of confidentiality (limited access / privacy), integrity (trustworthiness), and availability (access to) of the asset	Current protections: Describe how the asset is currently protected.	Open vulnerabilities: Describe known weaknesses in how the asset is currently being protected and why this vulnerability is being allowed to exist.
Bitwarden	Primary threats would be data breaches, phishing, or malware I may come across. Another primary threat would be forgetting the login information to the account. If anyone gains access to my vault, they gain access to all of my important accounts.	10 for criminal threat. Bitwarden is an organization that cyber criminals that malicious organizational insiders will look at. This application holds financial information 5 for loss of password. It is highly possible that I may forget my password if I don't use my account for a while, but I do have hard and soft copies of where my password is.	Confidentiality: Loss of confidentiality would expose stored login credentials and personal information. Integrity: A compromised vault would mean that people can steal, delete, or modify credentials that I have, which will lead to problems later on. Availability: Losing access to Bitwarden would mean that I may lose the passwords to valuable accounts.	Bitwarden is protected with a unique master password and 2FA that I have set up.	If my master password is compromised in any way, 2FA will stop someone from gaining access to my vault. But if the person has access to my vault and the authentication app that I have linked to it, there is a chance that someone can get into it.
Financial Account	Primary threats would be unauthorized access in terms of credential theft or a data breach happening within one of my banking institutions.	10 for criminal threat. Financial accounts are a big target for criminals. Though my banking institutions haven't had any breaches so far, it is definitely possible. 4 for loss of password. I can always do forget password and make a new password through personal credentials that only I know.	Confidentiality: Financial data can be stolen, which can lead to identity theft. I would lose money and transactions would be done under my identity. Integrity: Attackers can redirect payments or make false transactions. Availability: Losing access to my account could delay payments that I may need to make, impact my credit, or stop me from making certain financial decisions.	Accounts have unique credentials that a password manager holds. My banks also require me to have a strong password and 2FA.	My main bank account is connected with my mother. If someone can someone gain one of our credentials, it is possible for them to gain access to all our money.
Physical Forms of Identification	Primary threats would include theft, loss, or damage of these items. Someone can get these documents and take over my identity, which would mean my identity will no longer be what I say it is.	5 for criminal threat. Someone would have to physically break into my house and figure out where it is specifically located in order to find where these documents are. It is possible though since people have broken in before and I live in a dangerous area. 3 for loss of identification. I only bring these documents out unless I absolutely need to. There is a chance I could lose it on my way to where I need it.	Confidentiality: Loss of documents will lead to financial fraud or identity theft. Integrity: IDs can be forged or taken and someone can pose as me for personal data they may want. Availability: Losing physical identification will disrupt access to essential services, like getting a job.	Documents are stored in a place I can share, but at the same time, no one knows what it looks like. Only I know where it is.	There are natural disasters or burglaries that may happen that I can't exactly control.
Cell Phone	Primary threats include theft, malware, or remote access. Attackers could get information from my cell phone if they were to connect to it somehow.	7 for criminal threat. 2 for loss of access. Phones are big targets for criminals to look for. There are methods to ensuring that they can't get into your phone like biometrics and features like Stolen Device Protection.	Confidentiality: Loss or compromise can expose personal information, passwords, MFA tokens, etc. Integrity: Malicious apps or unauthorized users can copy or modify data and install spyware, which can be linked through the cloud and gain access to other devices. Availability: Loss, damage, or losing access to the password will disrupt my daily routine.	The phone is secured through my biometrics and a password that only I, my sister, and friend know. It also has the Find My feature and the Stolen Device Protection feature on.	Access could be gained through malicious wifi networks or usb connections. Though these are turned off on my phone, access can still be gained.

Password Management

Email: akcguillermo@gmail.com

Master Password: [REDACTED]

Backup Email: [REDACTED]

MFA: 2FAs

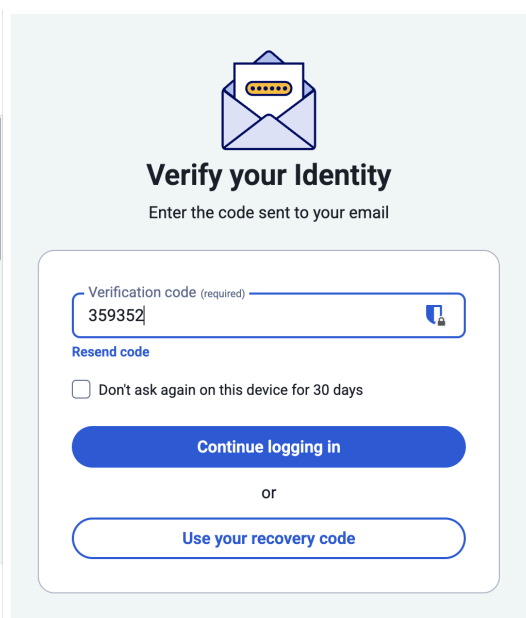

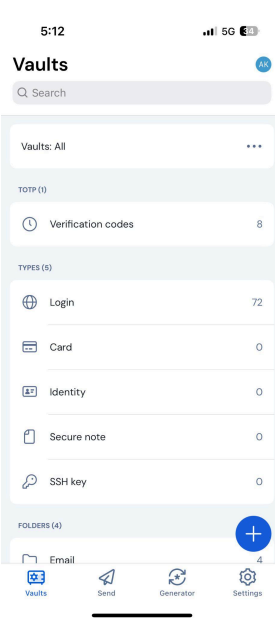

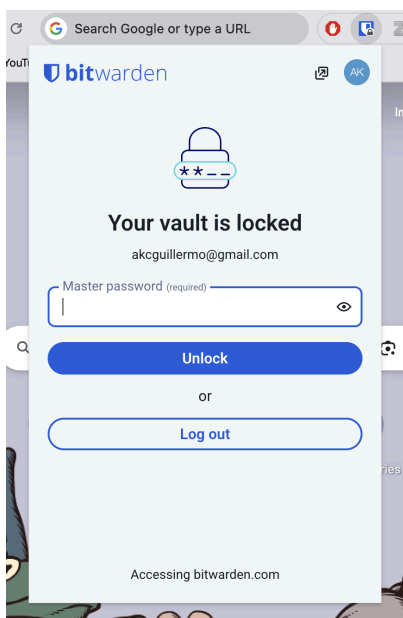

The password manager I chose to use is Bitwarden. Bitwarden securely stores and manages login credentials. It also generates strong and unique passwords catered toward your preference or requirements. This eliminates the need to remember these passwords while also keeping sensitive data safe. This is something I am going to continue using as it's useful and convenient. There is reduced risk to information being breached. Bitwarden also provides information in which accounts may have the same or weak passwords. Ensure that your password manager has a very strong and unique password. Not doing so will lead to an attacker gaining all passwords in the password manager to be compromised all at once.

Bitwarden

Currently, I am part of [REDACTED] Bitwarden Enterprise, which gives me premium features of Bitwarden. My laptop [REDACTED] and phone [REDACTED] have Bitwarden installed. I share my password for my password manager with my friend, Jezelle. There is a hard copy given to her and a hard copy placed in my gray basket with my other personal identification forms. There is a soft copy of the password in my notes app on my phone. The password manager is used for all accounts that require a password that my biometrics can't open (face ID or fingerprint don't work). Bitwarden is primarily used on things that I open on my MacBook, so every time I use my MacBook is when I will use the password manager.

There is an encrypted soft copy on my desktop (MacBook Pro) called [REDACTED]

[REDACTED] In the case that I need to access this or lose my vault, this can be imported, along with the email and master password.

Tool for password usage

Reused passwords

Reusing passwords makes it easier for attackers to break into multiple accounts. Change these passwords so that each is unique.

Reused passwords found			
We found 3 passwords that are being reused in your vault. You should change them to a unique value.			
Name	Owner	Times reused	
Snapchat	Me	Reused 3 times	
Spotify	Me	Reused 3 times	
Twitch	Me	Reused 3 times	

[Back to reports](#)

Weak passwords

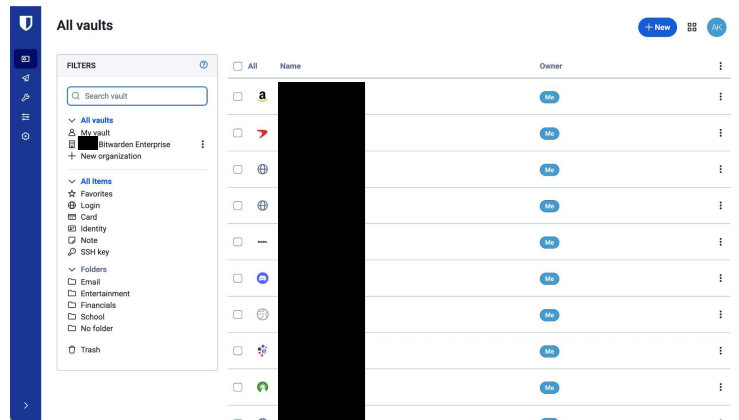

Weak passwords can be easily guessed by attackers. Change these passwords to strong ones using the password generator.

Weak passwords found			
We found 3 items in your vault with passwords that are not strong. You should update them to use stronger passwords.			
Name	Owner	Weakness	
Discord	Me	Weak	
Instagram	Me	Weak	
Starbucks	Me	Weak	

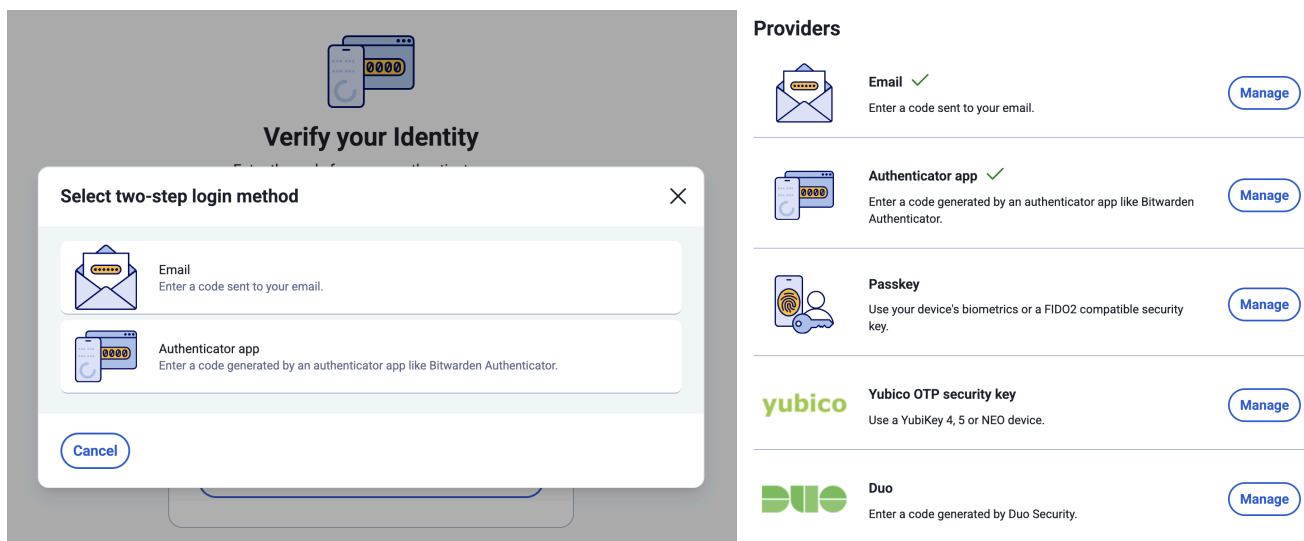

[Back to reports](#)

After seeing that there are reused and weak passwords, I have changed the passwords using the random password generator and ensuring there is MFA for some of the accounts.

Proof of Vault

Proof of 2FA for Bitwarden

Notes App (passwords)

With the notes app, I have a locked note with passwords to accounts I have created. It can only be opened through face ID, fingerprint, or phone password. The list has applications or accounts that were needed to be created and accounts that are also in Bitwarden. The compromising of this notes app will be dangerous, but all the important accounts have MFA or alerts when logging into the account. The notes app is also shared through my iCloud so that all my devices have this information in the case it's not saved on the device I'm trying to log in on.

Multi Factor Authentication (MFA)

Multi-Factor Authentication (MFA) is a verification process to access an application or account of desire. This ensures that the user trying to log in is the person who they say they are. MFA comes in many different forms, such as biometrics, texts, emails, authenticators apps, etc. My primary MFA apps are 2FAs and Bitwarden, for TOTP. Another method of MFA that I highly use is SMS. Listed down below are important accounts with MFA methods available and chosen. Most applications are accessible through biometric authentication, either through Face ID for my mobile phone or fingerprint for my MacBook and iPad Mini. To ensure that accounts are protected, only my biometrics are on my devices and passwords are shared with my sister, [REDACTED] or my best friend, [REDACTED].

Backup Plan if MFA unavailable

If MFA is not available, I need to ensure that a backup method is available. This can be done by using an authorized device, having a backup email, or backup contact that I can confirm my authorization with. These backup plans are only good if the following are available: MacBook, iPad Mini, mobile device, email (personal and backup), or contacts (Mom [REDACTED], Sister [REDACTED], Friend [REDACTED])

Last Modified: October 21, 2025

SMS #: [REDACTED]

Email: akcguillermo@gmail.com

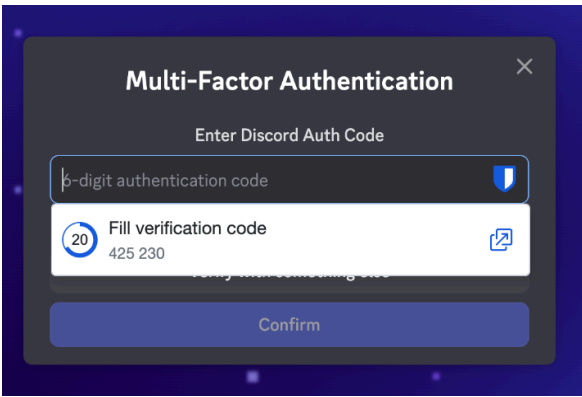

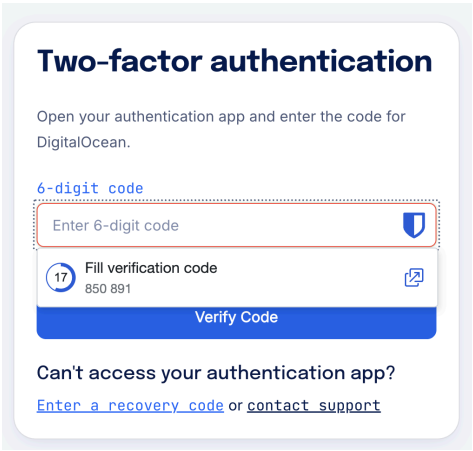

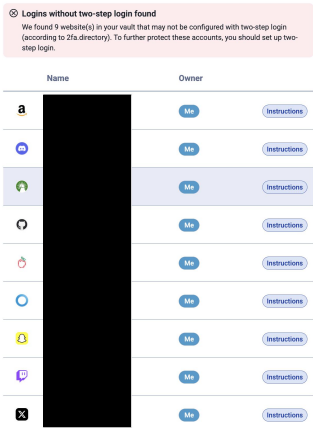

Backup Email: [REDACTED]

Authenticator App: 2FAs or Bitwarden

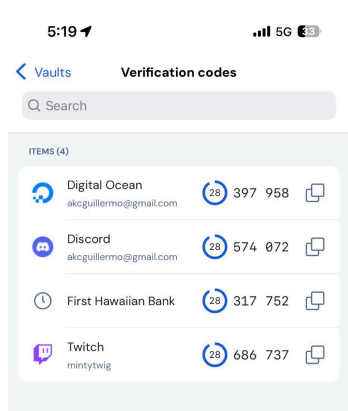

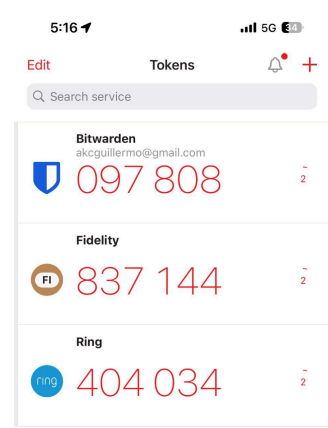

MFA Accounts	Methods Available	Methods Chosen	Backup Method
UHFCU	SMS, email	SMS	email
School Email	Duo push, phone call, duo code, SMS	Duo Push	SMS
Personal Email	Email, backup email	Email through different device	Backup email
Amazon	SMS, passkey, authenticator app	2FAs	SMS
Capital One	SMS, email, authenticator app, push notification	SMS	Email
Ring	Authenticator app, SMS	2FAs	SMS
Fidelity	Authenticator app, OTP SMS or call	2FAs	SMS

Bitwarden	Authenticator app, SMS, email	2FAs	Email
Twitch	Email, authenticator app, SMS	Bitwarden	Email
CareCredit	Email, SMS	SMS	Email
ProService	SMS, Email	SMS	Email

Proof of MFA

Proof of TOTP

Data Backup & Recovery

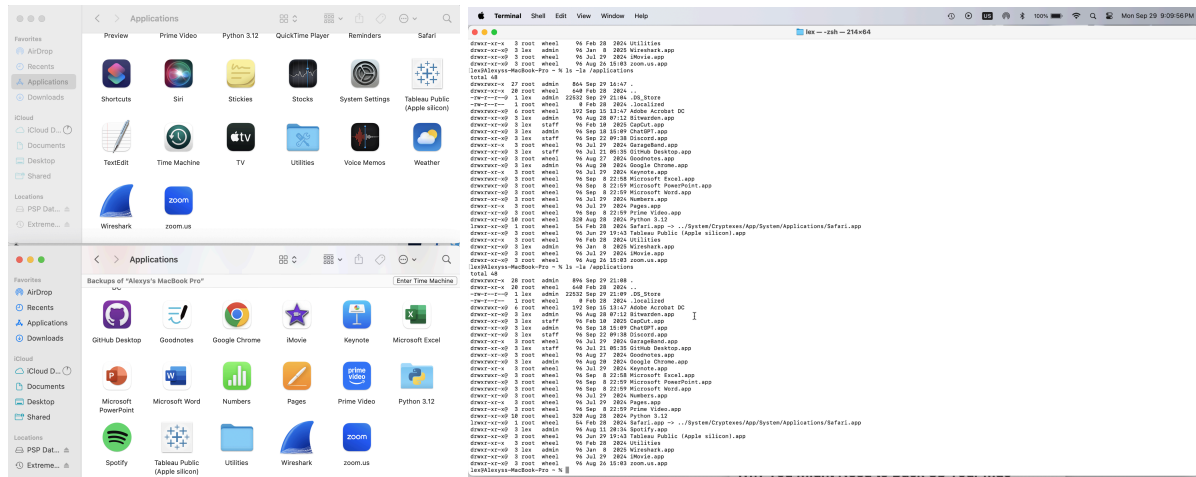

Data Backup & Recovery is to ensure that there isn't data loss due to hardware failure, cyberattacks, or plain old human error (forgetting passwords, misplacing files, etc.). These things can happen at any time and place. Having more than one backup and ensuring that these backups are done in a timely manner makes life easier and smoother. Using applications and having those reminders will ensure that backups are done in timely manners.

MacBook Pro Backup

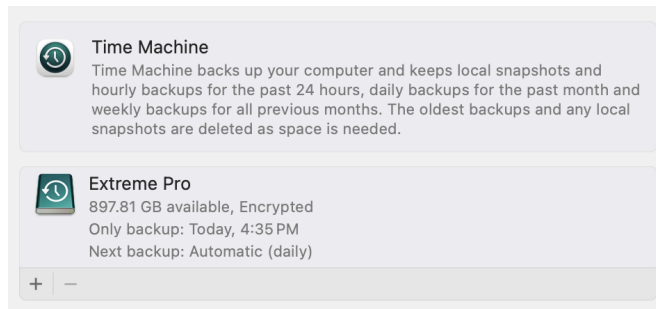

Data backup for my MacBook Pro is stored on a hard drive called Extreme Pro. Time Machine is an app on the laptop that manages backups and are done in timely manners. It will provide information based on what kind of device it was backed up to, when it was last backed up, and how much space there is. The data backup happens every time I connect my hard drive to my laptop. This will be done every week or so as the time machine app reminds me, or when absolutely needed. A good example of when to back up my laptop would be when I take it on trips. After backing up my data on the hard drive, it'll get backed up onto my laptop. I will have an on-site backup of my laptop and a backup on the hard drive.

I have tested recovery by uploading the laptop on the hard drive, then deleting Spotify on my laptop and then reconnecting the hard drive to get Spotify back. To reduce the amount of risk of needing to grab material from the backup, I will ensure that only necessary downloads are done or I can delete files that are not needed.

Proof of Testing Backup

Proof of Backup

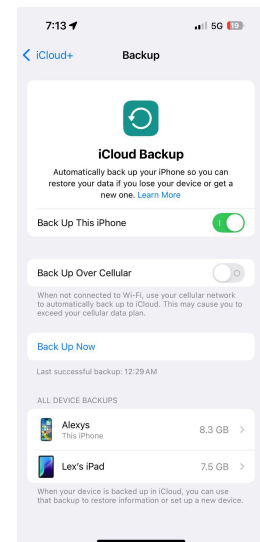

Mobile Phone Backup

Data backup for my cell phone is done every day over wifi. I trust that this process works always because I have been doing it since I got my first iPhone, which has been for 10 years. In the case that I do lose my phone or it breaks and I can no longer access it, everything should be over the cloud. Important documents are shared through hard copy with multiple copies given to other people or in my files app, which is connected with iCloud so I can share documents through multiple devices.

iPad Mini Backup

Data backup for my iPad Mini is also done every day over wifi. Backup for this device isn't a priority as a lot of things that are done on this device are transferred and stored to my MacBook or phone.

Category	Where and Who (access)	Importance (low, medium, high)
Subscriptions	Soft copy shared with mother	Low
Financial Accounts	Hard and soft copies, partially shared with mother	High
Mobile Phone	Soft copy, shared with sister and friend	High
MacBook	Soft copy	Medium
Bitwarden Vault	Hard copy owned by me and Jezelle, soft copy on phone	High

Change of Access or Passwords

- Financial Accounts
 - Every couple of months, some institutions require it to be changed
- Text Messages and Emails

- Every year, unless needs to be cleared earlier for storage
 - Keeps records of things (schedules, pictures, warranty, etc.)
- Devices
 - Backups should be done as frequently as possible
 - MacBook should be backed up at least once a week
 - Phone and iPad Mini should be backed up while on wifi if storage permits
- Asset Inventory
 - Every time major asset is added or changed
- Bitwarden
 - Password should be changed every 6 months
 - Back up vault every month
- Applications
 - Automatic updates
 - MacBook - CleanMyMac
 - iPhone & iPad - iVerify and app store

Data Backup Plan

3 Data Copies

Local - This comes with the device. This computer is only about a year old and it shouldn't die any time soon. I have constant access to this while working on my device. Since devices are also expensive, I plan to take care of it for as long as I can and try to keep it running for as long as possible.

External - The external drive I have is something that I will backup every so often. With continuous projects and movement, I back my computer up when I add big projects or when I need to transport my device somewhere. This allows me to have a backup for the local copy.

iCloud - As long as I'm logged into my iCloud account and it has enough storage for me to keep adding data, I will keep this as one of my data backup sources. Data is constantly being updated into my iCloud since I am always using these devices. My devices also don't work unless I'm connected to wifi so I can guarantee this method is strong.

2 Media Types

Solid State Drive (SSD) - This is the internal drive that comes with the device being used. There is a folder with important information that I may need to access. As long as I can take care of my device, there shouldn't be any reason as to why my SSD won't hold any data correctly.

External Pro (hard drive) - This is the external drive that I have chosen to have all my backup data stored on. As long as I know where the hard drive is at all times, this will be no problem for a backup source.

1 Offsite Copy

iCloud - This is the offsite copy that I have chosen for backup. I also consider this the easiest method of backup. It just allows me to access documents through different devices in the most efficient way. As long as I can make sure that I keep access to my iCloud safe, this will be a reliable backup source.

Application Enumeration

CleanMyMac is the primary application that will keep track of my MacBook. In terms of keeping track of what apps I use on my phone, I will only be using apps from the app store. iVerify will also alert me when something isn't normal on my phone. This is explained more in the iVerify section of this document. Apps between my phone and iPad are the same as they are synced so my iPad mini will be as regulated as my phone.

Consensus

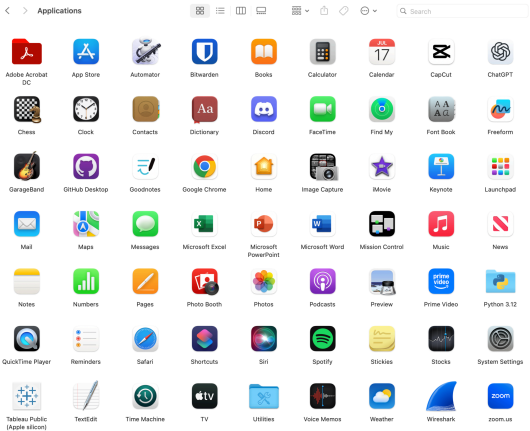

There was a difference of apps from the manual count compared to CleanMyMac. There are applications that were counted in one, but not counted in the other, and vice versa. Both methods didn't account for all apps. CleanMyMac counted certain apps that weren't in the manual app inventory check. A lot of the differences came from apps that already come with the computer. I believe CleanMyMac found apps that have a lot more impact on your information compared to the ones from manual inventory. For example, I don't think Chess would make a big difference in how it affects my computer other than storage because I don't use it. I would find more focus on apps that were downloaded from Chrome and such as they aren't as regulated as apps from the app store since there are automatic updates.

Overall, I will continue to use the free version of CleanMyMac to ensure my device stays free from most vulnerabilities. It also ensures that my laptop stays clean from repeats and such. It shows duplicate downloads, files to review for storage, and updates to look out for. This application should be run every time I use this laptop.

Manual inventory

Adobe	Google chrome	Python 3.12
App store	Home	Quicktime player
Automator	iMovie	Reminders
Bitwarden	Keynote	Shortcuts
Books	Launchpad	Siri
Calendar	Mail	Spotify
Capcut	Maps	Stickies
ChatGPT	Microsoft Excel	Stocks
Chess	Microsoft Powerpoint	Tableau public (apple silicon)
Clock	Mission control	Textedit
Dictionary	Music	Time machine
Discord	Notes	TV
Facetime	Numbers	Utilities
Find My	Pages	Weather
Font book	Photo booth	Wireshark
Garage band	Photos	Zoom
Github desktop	Preview	
Goodnotes	Prime video

Version History (October 21, 2025)

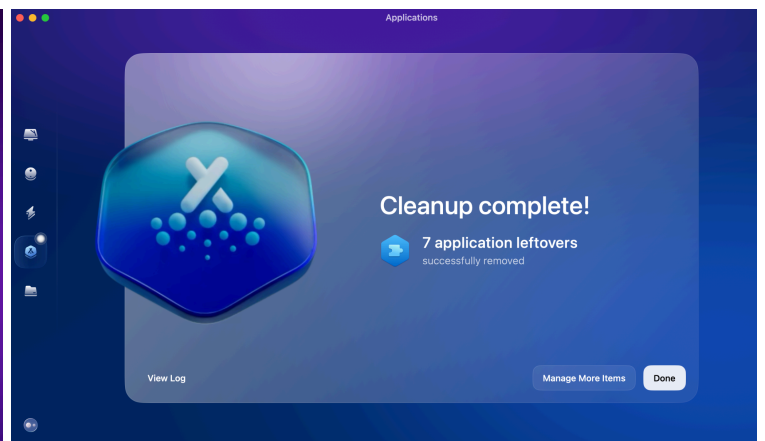

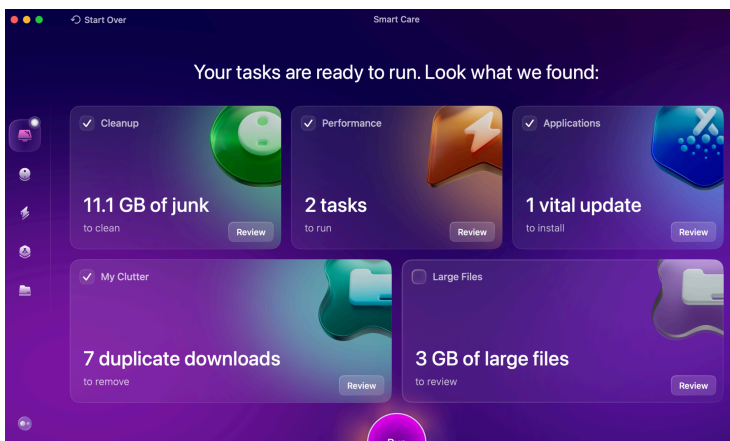

App	Version (October 21, 2025)
Bitwarden	2025.10.0
Zoom	6.5.12
CleanMyMac	5.2.6
Adobe Acrobat	25.001.20693
Github Desktop	3.5.2
CapCut	5.7.0
Discord	0.0.364
Microsoft Excel	16.101.1
Microsoft Word	16.101.1
Microsoft PowerPoint	16.101.1
Tableau	2025.2.0
Prime Video	10.97
ChatGPT	1.2025.260
Spotify	1.2.73.474
Wireshark	4.4.3
Python	3.12.5
Pages	13.2

Numbers	13.2
Keynote	13.2
iMovie	10.4
GarageBand	10.4.10
Visual Studio Code	1.92.2
Python Launcher	3.12.5
Goodnotes	6.3.56
Google Chrome	141.0.7390.109
Spotlight	3.0

Inventory app (CleanMyMac)

Garage band
 Goodnotes
 iMovie
 Keynote
 Microsoft Excel
 Microsoft Powerpoint
 Microsoft Word
 Numbers
 Pages
 Prime Video
 Capcut
 ChatGPT

CleanMyMac
 Discord
 GitHub Desktop
 Google Chrome
 IDLE
 Python Launcher
 Spotify
 Tableau Public
 Visual Studio Code
 Wireshark
 Zoom

Standard Operating Procedure

The way I can keep track of applications is ensuring that I'm the only one who can download them. This is done by putting a biometric feature before an application can be downloaded. This means my face or finger are needed, so I need to be present in order to download anything. Usually the web apps will remind me if it is outdated or it is automatically updated through the app store if downloaded through there. For downloading other files, I will ensure they are safe enough for me to download. If the file or app is no longer needed, it should be deleted immediately after use.

Updates

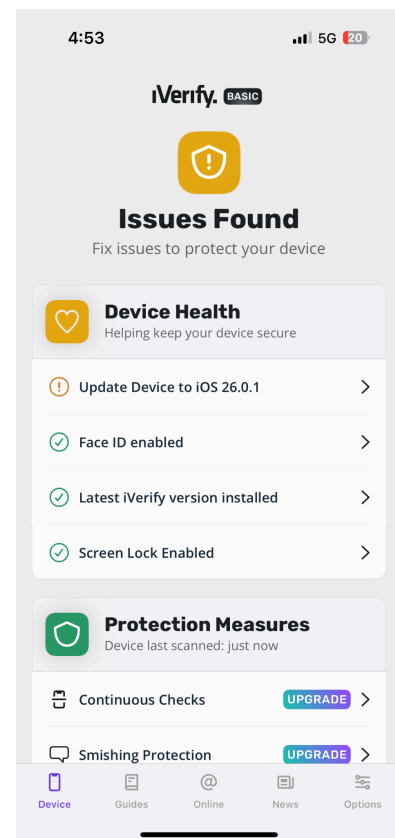

Auto-updates are set on all my devices. This ensures safety and efficiency when using the device or apps. Not having the device or apps updated can lead to vulnerabilities being exposed.

iVerify

iVerify is an app that detects threats on a user's device to protect their privacy. This tool is used to monitor and help you respond to any threats or information that you may need to address.

Using this app helped me with problems I didn't know could be prevented. There are also some things that the iPhone has that I didn't know could be a threat to me. Going over the guides has helped me ensure my safety. There are some features that I wouldn't want to follow through with, but could be considered dangerous. For example, disabling bluetooth would be a hassle for me just because I use bluetooth to connect to speakers, Carplay, airpods, etc. Turning it off would make things very inconvenient for me. Overall, this app opened a new perspective on potential vulnerabilities that I never thought there would be.

Listed down below are tables as to why or why not some of the features are turned on or off. Some features may be used later on in the future, such as Emergency Reset. This app also sends notifications that need your attention. For example, I have a notification from the app telling me to download and update to iOS 26.0.1.

Protect Against Theft

Protect Against Theft	Upgrade to an A12 CPU or higher	Yes , my device already has this.
	Enable Automatic Updates	Yes . This allows me to ensure my apps and devices aren't vulnerable to security breaches and are up to date without having to do unnecessary work.
	Disable Control Center	Yes . After learning that people can access your device through the control center, I turned this off. This also prevents people from using my phone when they shouldn't be touching it.
	Enable Find My	Yes . I use this for all my devices in the case that I misplace one. I use Airtags so that things like my keys and wallet are tracked. I also use it to share my location with others for my safety.
	Enable USB Restricted Mode	Yes . I don't want my phone connected to random devices This would ensure someone can't access my device without my permission.
	Learn to use Emergency SOS	Yes . It's a good feature to use with the iPhone, but I've had problems with it before. There are some problems with it though when the buttons are pressed, the feature turns on.
	Enable Stolen Device Protection	Yes . I have this enabled because my phone has been stolen before by someone I trusted and this ensures that only my biometric data is used to open my device. I also made it so that after a certain amount of attempts, the phone gets wiped.
	Learn to use Emergency Reset	Yes , knowing how to use Emergency Reset is good. Though I don't need it right now, I'll know how to use the feature when I do need it.
	Learn to use Lockdown Mode	Yes , I learned how to use lockdown mode, but since I don't believe I've been attacked, I am not turning this on. In the case that I do, I know how to use the feature.

Limit Software Exploits

Limit Software Exploits	Disable Airdrop	No , I don't have airdrop completely disabled. It's only on for contacts, so Airdrop is only possible for numbers I have. I also disabled the feature where you can tap your phone on someone else's to share something. This feature is unsafe as random people can just connect to your device.
	Enable Automatic Updates	Yes , this allows me to be updated and ensure that apps don't have any security breaches.
	Disable JavaScript in Safari	No , I use Safari as my main app for using the internet.
	Disable Personal Hotspot	Yes . This is turned off almost all the time as I don't want people connecting to my hotspot. It also kills my phone's battery.
	Periodically reboot your device	Yes . I do this when my phone crashed from using it for too long or sometimes it will just crash randomly. Rebooting allows my phone to work. This is also done when I need to turn my phone off for important events and occasions.
	Recognize the recording indicators	Yes , I recognize the recording indicators because they show up when certain apps are opened. This also allows me to know what apps are running that don't need to be running.
	Install applications only from App Store	Yes , I don't trust downloading devices that are not through the app store. It is also a hassle downloading apps from the internet as there are other things you may need to do.
	Enable Rapid Security Responses	Yes , enabling this feature allows your phone to have rapid security responses, which will help in cases where there is a problem with security.
	Learn to manage custom keyboards	Yes . I have learned how to manage it, but this is prevented as I only download keyboards through settings.
	Disable Bluetooth	No . I am constantly connected to Bluetooth (airpods, CarPlay, speakers) so this would be a hassle for me to turn on and off.
	Enable Advanced Data Protection	Yes . This allows me to encrypt data and only have me as the person who can access my iCloud data. My recovery method is a contact that I trust.

Review for Compromise

Review for Compromise	Review Google Maps location sharing	No. I don't have Google Maps.
	Review Sharing & Access	Yes. I reviewed this because I was curious to see what I was sharing with who or what. This allowed me to remove apps and people from sharing certain things with me.
	Review Developer Mode	Yes, I have reviewed developer mode and I don't have it.
	Review Find My location Sharing	Yes, my location is only shared with my own devices or family/close friends that I trust. I don't need or want people knowing where I am unless I'm okay with it.
	Review alternate Face ID appearances	Yes. After review, I only have one Face ID on my phone due to the Stolen Device Protection feature.
	Remove unknown devices from iCloud	Yes. Only devices I use currently are on my iCloud. I am also the only person on my iCloud.
	Look for suspicious configuration profiles	Yes. I make sure there are only trusted profiles on my accounts. I don't share accounts with anyone unless it's a subscription shared with family (sister and mom).

Protect Wireless Data

Protect Wireless Data	Disable Bluetooth	No. I am constantly connected to Bluetooth (airpods, CarPlay, speakers) so this would be a hassle for me to turn on and off.
	Disable Wi-Fi sync	No. I transfer a lot of things through my phone, laptop, and iPad over wifi. Since I don't connect to public wifi, having this feature on isn't too bad.
	Limit Bluetooth Access	Yes. I don't need apps accessing my bluetooth so this is turned off for all apps.

Protect Your Communication

Protect Your Communication	Disable calls on other devices	No. There are times where I don't have my phone or don't want to use my phone, so havnig this feature will allow me to answer from a device other than my phone.
	Disable Handoff	No. Since I do a lot of work through my Apple devices, turning this off would make work less efficient.
	Hide notification previews while locked	Yes. I don't want or need people looking at my notificaitons when my phone is locked, personal or not.
	Disable Significant locations	Yes. I don't need my phone tracking where I am at certain times and days. There is nothing that important where I need my phone to have significant locations.
	Clean up SMS Codes Automatically	Yes. Some codes last for a long time and this can prevent unauthorized logins. There is also no use for a used code.

Prevent Ad Data Leakage

Prevent Ad Data Leakage	Disable loading of remote E-mail messages	Yes as I don't even have the Mail app. In the case that I do, I know I am protected from spam and people knowing I opened their emails.
	Enable Safari Advanced Protection	Yes, I have private browsing enabled because I like browsing in private mode. It makes me feels safer even if it doesn't make a big of a difference.
	Disable tracking across apps	Yes, I don't need apps to track my activity for any reason.
	Disable personalized Ads	Yes, I don't want to see products or anything pop up tailored to what I searh up or what I'm interested in without my consent.

Personal Security Plan Reflection

The Personal Security Plan (PSP) offers insight and provides a plan in the case that I no longer remember what I have or what is currently contained in my digital life. Working on this PSP has made me realize we are vulnerable to a lot of different applications, files, and just the internet overall. Though it was a very long and tedious process, it has helped me understand that taking these measures are a lot better than just leaving information vulnerable.

One big example of a vulnerability in life that I did not know about are the credit freezes. I didn't think that freezing your credit was a possible thing to do. After learning more about it and how advanced technology is getting, freezing my credit is something I will carry on. It is a lot easier to have my credit frozen than to worry about someone stealing my identity and credit. After watching the movie, *Identity Theft*, losing my identity is something I wish not to go through.

Having to do a list of assets allowed me to understand that there are more things that we own. Though I probably didn't get all of the assets down, most of the things listed are important assets I have remembered about that affect my life currently. As I grow older, this list will change. This will be updated for when I have major changes in assets.

Another example of something that I will carry on throughout my life is a password manager. It is a lot easier than just having a notes app with usernames and passwords. This way, it also links websites to accounts so that it can autofill logins for me. Before Bitwarden, I had manually written passwords in my notes. Sometimes I got lazy and just only made the password and didn't write it down, which made me press "Forgot Password?" and reset the entire process. Bitwarden also allows me to know what accounts I have that I have possibly forgotten about. It also just makes account and password management 100x easier.

Using an MFA most definitely helps especially if there are any shared accounts or accounts that may be vulnerable. I have had experience where someone has gained access to an account, which had my card information, and that account didn't have MFA. Though it may be a little bit of a hassle to do sometimes, it is better to have that extra layer of security and not lose \$200 because someone bought 2k and Call of Duty games.

The section about backing devices up made me realize that I should take it more seriously and just come up with a system that will make this process easier. Having a hard drive to back up my MacBook is really easy. All I have to do is connect the hard drive to the computer and let it run until it's all good. After that, I will just try to make sure that data is uploaded to the cloud consistently for my MacBook. As for my iPad and mobile phone, I will just ensure that as long as I'm connected to wifi and I have enough storage, my iCloud will constantly be up to date.

Application enumeration was something that interested me the most. It's interesting to see how a manual inventory differs from an app doing inventory. There are a lot more things to your device that you may not see from the surface level. This helped me understand that you must be aware of what you download and who has access to make these downloads.

The iVerify guide was something very tedious, but it brought attention to features that I did not know about, such as the Stolen Device Protection feature or knowing how to use the Advanced Data Protection. In the case that I do need to put attention to these features of any sort, I can look back at this app.
